ABSTRACT

15

The invention concerns a method for processing messages incoming on a gatekeeper system of an Internet Protocol network, characterised in that the method includes a plurality of sub-processes each
20 able to process a series of such messages and the method includes the step of dispatching the messages incoming on the gatekeeper system onto those different sub-processes, the dispatching step including identifying whether a message belongs to a same call as a previous message, and, in that case, sending this message to the same sub-process as said previous
25 message.
